September 2, 2013

## 1 Introduction

This introduction to FRC programming assumes pre-existing Java programming knowledge and basic syntax understanding.

If you do not have a fundamental understanding of Java, that is fine, however, to write code for FRC, you will need to learn the basic syntax. You may want to take a look at these links, as well as look into Java on your own:

<http://docs.oracle.com/javase/tutorial/java/>  
<http://docs.oracle.com/javase/tutorial/>

Programming for FRC will require a configured Netbeans and Subversion environment. This document is designed to walk you through the setup process. While a Windows computer is not *required* for FRC development, it is highly recommended. If you cannot use Windows, then you will not be able to use TortoiseSVN, and may skip section 2 as it will not apply. Instead, for Subversion access, refer to section 3.2.

Once you have completed the FRC introduction sets, you may be given commit access to the FRC repository.

## 2 Setting up the Subversion environment

*Note: You do not need to complete this section if you intend to use Subversion within NetBeans. If you wish to do so, skip to section 3.*

You may use whichever Subversion client you wish. However, we highly recommend you use TortoiseSVN (Windows only), which can be downloaded from here:

<http://tortoisesvn.net/downloads.html>

TortoiseSVN opens in a context menu; right click anywhere, and you will see an option to “SVN Checkout.” Checking out is the process of downloading the archive from the repository, and committing is the process of uploading your changes back into the repository. From this window, you can check out any directory or subdirectory in the FRC subversion repository. The FRC page is located on Google Code here:

<https://code.google.com/p/frc-team-3128/>

From this page, you can view all of the content and change logs. For checking out and committing, the root of the SVN archive is located at:

<https://frc-team-3128.googlecode.com/svn/>

The following subdirectories are important to remember:

/svn/intro	This section contains all of the FRC programming introduction files
/svn/doc	This section contains all of the FRC documentation. It can be checked out and browsed by opening help-doc.html or index.html
/svn/trunk	This section contains the live robot code for FRC. This section is <i>only</i> code which is sent to the actual robot.

Once you are done setting up TortoiseSVN, you are free to explore the code archive online, or check out the archive and explore it there. You can open the project within NetBeans by going to the File menu and selecting Open Project...

## 3 Setting up the NetBeans environment

Once you have completed these steps, it is highly recommended that you download the “svn/doc” folder and look through it.

The entire API we have written has Javadoc, which means that hovering over a function will show the description, parameters, and return values.

### 3.1 Installing and configuring the FRC environment

1. Download and install Netbeans 7.2.1 *specifically* (you will need the latest Java Development Kit (JDK))
2. Go to *Tools* → *Plugins* → *Settings* → *Add*
3. Enter “FRC Java” under New Provider
4. Enter the following link under URL:

`http://first.wpi.edu/FRC/java/netbeans/update/updates.xml`

5. Go to the Available Plugins tab and click Check for Updates
6. Find all plugins that start with “FRC” and select them. Install those.
7. Close the Plugins dialog
8. Go to *Tools* → *Options* → *Miscellaneous* → *FRC Configuration* and enter 3128 under “Team Number”
9. Click OK

Once you have checked out the introductory tasks, you can open them by going to *File* → *Open Project...* and finding the Java project.

### 3.2 Optional: Checking out projects with Subversion in NetBeans

1. Go to *Team* → *Subversion* → *Checkout* (there may be an option to check out without going through the Subversion menu)
2. Enter the repository URL (be specific with this, else this will be confusing and take a ridiculous amount of time to finish); leave the username and password blank
3. Select the project from one of the checked out ones

The NetBeans subversion menu is available by right clicking in the Projects pane; it is available at every scope. **Please do not commit private.xml.**

## 4 Running the introductory tasks

The introductory tasks are all located at:

`/svn/intro`

There are five subsections in the intro folder. Each subsection contains its own tasks. The files with the introductory tasks are located within the folders; for instance, task 01 is at:

`svn/intro/01 - Basic Usage/01 - DebugLog usage.txt`

Once you’ve worked through one of these, call one of the programmers over and we will look through and comment on your code. Once you’ve completed a task, you are free to move on to the next one.

Welcome to FRC Robotics Programming! **Remember: Ask questions, get answers!**
